Safety Valve
Industries, Inc.

35,000 Safety & Relief Valves
Ready to Ship

When the pressure is on, trust North American Safety Valve Industries

We're Always on Standby

When you're under pressure, NASVI's ready to help.

New & Remanufactured Safety Valves

Extensive stock of new valves from trusted, top manufacturers and dependable remanufactured valves back by a 2-year warranty.

Same or Next-Day Shipping

Avoid or minimize downtime with NASVI's same or next-day shipping.

State-of-the-Art Repair & Setting Centers

Nearly every safety valve's specifications are at our technicians' fingertips for exact work. Generally, irreparable valves can be replaced from our in-stock inventory.

Turnaround Exchange Program

Receive the valves needed for installation prior to shutting down, then ship us the old valves for repair or exchange.

CROSBY H-SERIES
DIRECT SPRING SAFETY VALVES

Direct spring safety valves that provide comprehensive overpressure protection for ASME Boiler and Pressure Vessel Code Section I, and Section VIII steam safety applications

FEATURES

- ASME/NB certified capacities for steam.
- Set and tested on steam.
- Full nozzle flanged option.
- Restricted lift for customized capacity.
- Long service life.
- Low maintenance.
- Two ring set pressure and blowdown control.
- ISOFLEX seat tightness up to 93%. For seat tightness greater than 93% consult factory.

GENERAL APPLICATION

H-Series direct spring operated safety valves are the proven solution for comprehensive overpressure protection on steam safety applications including economizers, steam drums, superheaters, reheaters and more.

TECHNICAL DATA

Sizes:	1¼" F 1½" to 6" RR 10"
Orifices:	0.307 to 19.29 in ² (1.98 to 124.45 cm ²)
Connections:	Flanged or welded inlet
Temperature range:	1130°F (610°C)
Set pressures:	15 to 6200 psig (1 to 427 barg)
Code:	ASME Boiler and Pressure Vessel Code Section I, and Section VIII

APPLICATION

Complete overpressure protection for ASME B&PVC Section I

A complete safety valve package for utility and industrial steam generators and steam systems.

- Boilers with design pressures to 3100 psig (214 barg).
- Valves designed to increase plant up-times, extend maintenance intervals and increase total valve life.

Steam System Components

1. Furnace
2. Drum
3. Superheater outlet
4. Turbine
5. Condenser
6. Condensate pump
7. Boiler feed water pump
8. Cold reheat inlet
9. Hot reheat outlet

* A complete line of ASME Section VIII 'off-boiler' safety and pressure relief valves is available. Contact your local sales representative.

NOTES

1. Selection matrix shows valves in optimum locations - Styles HSJ and HCI may be interchanged to suit a specific application or to obtain a more economical selection.
2. For supercritical applications, consult your sales representative.

CROSBY H-SERIES

STYLE HE ISOFLEX DIRECT SPRING SAFETY VALVE

STYLE HE ISOFLEX®

Style HE ISOFLEX® safety valves are high pressure, high capacity reaction type valves designed specifically for saturated steam service on boiler drums with design pressures above 2000 psig (138 barg) up to critical pressure.

FEATURES

- Extends Up-time
 - ISOFLEX® seat tightness to 93% of set pressure ensures maximum generating times, extending maintenance intervals.
 - For seat tightness greater than 93% consult factory.
- Reduces Maintenance Costs
 - Exceptional seat tightness minimizes maintenance resources and repair times and reduces spare parts purchase and inventory costs.
- Easily Adjustable for ASME Boiler and Pressure Vessel Code Section I Requirements
 - Advanced trim design with backpressure assist closing feature and patented eductor control eliminates complex adjustments to obtain ASME Boiler and Pressure Vessel Code Section I required blowdown.
- Minimizes Installation Costs
 - Weld end valves shipped as two assemblies to minimize installation time and labor and no special vent discharge piping is required, saving costs.
- Installation and Maintenance Efficiencies
 - Packaging designed for quick and easy installation.
 - Ease of adjustment and maintenance with fewer parts.
 - Two-ring blowdown control is easy to set and adjustable in the field.

TECHNICAL DATA

Sizes:	2½" x 6" to 4" x 8" (DN 65 x DN 150 to DN 100 x DN 200)
Orifices:	1.840 to 7.070 in ² (11.87 to 45.61 cm ²)
Connections:	ANSI flanged or butt weld inlet and ANSI flanged outlet
Maximum temperature:	Up to 750°F (399°C)
Maximum set pressure:	Up to 3060 psig (211 barg)
Code:	ASME Boiler and Pressure Vessel Code Section I

CROSBY H-SERIES

STYLE HE ISOFLEX

PRODUCT OVERVIEW

The HE ISOFLEX incorporates our latest field proven seat tightness design which allows boilers to operate close to set pressure without leakage across the valve seat. The HE ISOFLEX also has a unique patented eductor control that permits the valve to attain full capacity lift at a pressure 3% above popping pressure to the requirements of Section I of the ASME Boiler and Pressure Vessel Code.

APPLICATION

The HE ISOFLEX safety valve is a high pressure, high capacity reaction type valve, designed specifically for saturated steam service on boiler drums having design pressures above 2000 psig (138 barg) up to critical pressure.

LOW FRICTION SET POINT ADJUSTMENT

Springs on drum safety valves have very high preloads. A thrust bearing (25) between the adjusting bolt (26) and top spring washer (21) makes set point adjustments precise and keeps friction torque low. The valve seats are protected from damage during set point adjustment by lugs on the upper spring washer (21) which engage the bonnet (17) to prevent rotation of the spring (20), spindle (12) and disc insert (5).

PRECISE POPPING AND BLOWDOWN ACTION

A dual-stage, controlled flow passage is formed by the eductor (9), disc holder (6) and the adjustable guide ring (10).

These flow passages co-act with the apertured guide ring to control the flow of steam to a chamber above the disc holder (6). Changes in chamber pressure plus the action of other internal parts ensure full opening without warning and also assist in positive blowdown of between 2% and 4%, as required by ASME I code, which is obtained by adjusting the guide ring. The adjustable nozzle ring (3) ensures accurate, warn-free and sharp pop action on opening.

TIGHT SHUT-OFF WITH ISOFLEX® DESIGN

The seat-level loading of the spindle (12) on the disc insert (5) ensures uniform seat-loading. The seating region of the ISOFLEX® disc insert is recessed for pressure loading and temperature equalization ensuring maximum seat tightness.

OPERATION

As pressure in the boiler increases to the safety valve set point, the valve will pop open. Steam then passes through a series of flow passages (A) and (B) which control the pressure developed in chambers (C) and (D), the excess steam exhausting through guide ring openings (E) to the valve body bowl (F).

As pressure in the boiler drops, the dynamic forces on the lower face of the disc holder assembly are reduced and the safety valve disc begins to close. Assisted by pressure in chambers (C) and (D), the valve at this point closes sharply and tightly.

Typical valve opening and closing curve

34	Forked lever pin	Steel	

A complete set of spare cotter pins (not listed above) is also recommended for proper maintenance of the valve

NOTES

- Consumable spare parts: valve parts which should be replaced as part of any disassembly. (Disc inserts must be replaced if seats are severely damaged)
- Repair spare parts: valve parts exposed to wear and/or corrosion during normal operation. They are in fluid flow paths and may require replacement as part of any repair.
- Insurance spare parts: valve parts exposed to process or environmental wear and/or corrosion and may require replacement as part of a major repair.

Emerson recommends that sufficient inventory of spare parts be maintained to support process requirements. Always be sure to use genuine Crosby parts to ensure continued product performance and warranty.

For information on installation and care, refer to Instruction No. IS-V3155B, 'Installation, Operating and Maintenance Instruction for Crosby Style HE Design III Self-Actuated Safety Valves'.

NOTES

- These style designations are for standard welded inlets. For optional CL 2500 flanged inlet valves, the "W" is dropped from the style designation.
 - Weld prep per customer's specifications. Safety valves must be mounted on a nozzle with an inlet diameter equal to or greater than the nominal valve inlet size, dimension A. See ASME boiler and pressure vessel code Section I and ANSI/ASME B31.1 for recommended installation.
 - Bolt holes straddle centerline on flanged connections.
 - Dismantling height: an additional 20 inches (508 mm) is required.
- Drain: main valve drain is ½" NPT.

CROSBY H-SERIES

STYLE HCI ISOFLEX DIRECT SPRING SAFETY VALVE

STYLE HCI ISOFLEX®

Style HCI ISOFLEX® has been designed for 300 to 3100 psig (21 to 214 barg) steam generators for use on drum service, superheater outlets, reheater inlets and outlets.

FEATURES

- Increases Operating Efficiency
 - Restricted Lift Option for customized capacity, reduced reaction forces, and boiler design standardization
 - Seat tightness up to 93% of valve set pressure. For seat tightness greater than 93% consult factory
 - Two ring control to adjust overpressure and blowdown independently
 - May also be used for ASME Boiler and Pressure Vessel Code Section VIII off boiler steam applications for higher operating pressures
- Reduces Maintenance Costs
 - Interchangeable spare parts minimizes inventory levels
 - Higher nozzle seat step to extend valve service life
- Minimizes Installation Costs
 - Packaging designed for quick and easy installation
 - Easy to set and adjust set pressure while in service

TECHNICAL DATA

Sizes:	1½" x 3" to 6" x 10" (DN 40 x DN 80 to DN 150 x DN 250)
Orifices:	0.994 to 19.29 in ² (6.41 to 124.45 cm ²)
Connections:	ANSI flanged or butt weld inlet and ANSI flanged outlet
Maximum temperature:	1130°F (610°C)
Maximum set pressure:	3100 psig (214 barg)
Codes:	ASME Boiler and Pressure Vessel Code Section I, and Section VIII

CROSBY H-SERIES

STYLE HCI ISOFLEX

PRODUCT OVERVIEW

The HCI ISOFLEX safety valve is a high capacity nozzle type valve suitable for saturated and superheated steam service. The valves are available in inlet sizes of 1½", 2", 2½", 3", 4" and 6" and in orifice sizes H2 to RR specifically designed for the power industry. Welded inlets and flanged outlets are standard, with flanged inlets (1) with full (removable) nozzles (2) also available.

The valves' relieving capacities have been determined by tests conducted in accordance with ASME Boiler and Pressure Vessel Code Section I rules. They are certified by the National Board of Boiler and Pressure Vessel Inspectors and listed in their publication 'Pressure Relief Device Certifications.'

HIGH CAPACITY

The adjustable nozzle and guide rings (3 and 12) utilize the reactive and expansive forces of the flowing steam to provide full capacity lift. Valve capacity is determined by the nozzle (1B) throat area alone. With high capacity valves, positive overpressure protection is achieved with the fewest valves.

TIGHT SHUT-OFF

The seating region of the ISOFLEX® disc insert (5) is recessed for pressure and temperature equalization, ensuring that the seats remain flat in service.

TWO RING DESIGN

Blowdown control is precise with two adjustable rings (3 and 12) - one each on the nozzle (1B or 2) and guide (11). Blowdown may be adjusted from 2 to 4% under operating conditions.

PRECISE POPPING POINT

Close machining tolerances ensure that the disc insert (5) is centered precisely and special guide and disc/disc holder materials and surface finishes ensure low friction guiding at all temperatures. Spring specifications are held to rigid tolerances and stresses are kept within lowest practical limits. The open bonnet exposes the spring to atmosphere, minimizing thermal effects. The valves open precisely at their established set pressure, even after repeated cycling.

NOTE

Full (removable) nozzles not available in P2 (8" outlet) R and RR sizes.

Inconel 625 nozzle available for high temperature applications

** Restricted lift valve (HCI-R) part only (see page 18).

*** SA-217 Gr. WC9 is Crosby's standard high temperature material.
SA-217 Gr. C12A is available as an alternative.

NOTES

1. Consumable spare parts: valve parts which should be replaced as part of any disassembly, and discs and disc inserts which must be replaced if seats are damaged.
2. Repair spare parts: valve parts exposed to wear and/or corrosion during normal operation. They are in fluid flow paths and may require replacement as part of any repair.
3. Insurance spare parts: valve parts exposed to process or environmental wear and/or corrosion and may require replacement as part of a major repair.

Emerson recommends that sufficient inventory of spare parts be maintained to support process requirements. Always be sure to use genuine Crosby parts to ensure continued product performance and warranty.

For information on installation and care, refer to instruction No. IS-V3143A, 'Installation, maintenance and adjustment instruction for Crosby style HCI ISOFLEX® safety valves'.

CROSBY H-SERIES

STYLE HCI-R ISOFLEX

STYLE HCI-R ISOFLEX®

Restricted lift feature

A restricted lift option is available on all HCI ISOFLEX® valve sizes with either flanged or weld end connections.

Style HCI-R's capacities may be adjusted from 100% to 30% of full rated capacity.

Restricted capacity = (% of restricted lift) x (ASME rated capacity).

- Eliminating over-capacity permits an economic distribution of relieving capacity between the drum and superheater valves, often resulting in a smaller superheater safety valve selection.
- Reduces reaction forces.
- Standardization of valve sizes allows boiler manufacturers to build standard boilers.
- Quality and performance assured via tamper-proof installation that prevents erroneous changes in capacity.

NOTE

For information on installation and care, see instruction No. IS-V3143A, 'Installation, maintenance and adjustment instruction for Crosby style HCI ISOFLEX® safety valves'.

NOTES

1. These style designations are for standard welded inlets. For optional flanged inlet valves, the 'W' is dropped from the style designation.
 2. Dismantling height: an additional 20 inches is required.
 3. Weld prep per customer's specifications. Safety valves must be mounted on a nozzle with an inlet diameter equal to or greater than the nominal valve inlet size, dimension A. See ASME boiler and pressure code Section I and ANSI/ASME B31.1 for recommended installation.
 4. Bolt holes straddle centerline on flanged connections.
- Drain: ½" NPT for inlet sizes 1½" to 4" and ¾" NPT for 6" inlet size.

NOTES

- These style designations are for standard welded inlets. For optional flanged inlet valves, the 'W' is dropped from the style designation.
 - Dismantling height: an additional 508 mm is required.
 - Weld prep per customer's specifications. Safety valves must be mounted on a nozzle with an inlet diameter equal to or greater than the nominal valve inlet size, dimension A. See ASME boiler and pressure code Section I and ANSI/ASME B31.1 for recommended installation.
 - Bolt holes straddle centerline on flanged connections.
- Drain: ½" NPT for inlet sizes 1½" to 4" and ¾" NPT for 6" inlet size.

CROSBY H-SERIES

STYLE HSJ DIRECT SPRING SAFETY VALVE

STYLE HSJ

Style HSJ is a full nozzle reaction type safety valve designed for saturated and superheated steam service on drums, superheater outlets, reheater inlets and outlets and economizer applications.

FEATURES

- Increases Operating Efficiency
 - FLEXI-DISC seat design is recessed for pressure and temperature equalization, ensuring a flat and tight seal.
 - FLEXI-DISC seat tightness up to 93%. For seat tightness greater than 93% consult factory.
 - Meets the requirements of ASME Code Section I, Power Boilers and Section VIII for steam service.
 - May also be used for ASME VIII off boiler steam applications for higher operating pressures.
- Reduces Maintenance Costs
 - Replaceable full nozzle design requiring no special tools facilitates ease of maintenance and longer service life.
 - Single bonnet design allows set pressure changes simply by changing-out the spring.
- Minimizes Installation Costs
 - High discharge coefficient results in the most economical valve selection.

TECHNICAL DATA

Sizes:	1½" x 2" to 6" x 8" (DN 40 x DN 50 to DN 150 x DN 200)
Orifices:	0.307 to 11.045 in ² (1.98 to 71.25 cm ²)
Inlet ratings:	ANSI Class 150 to 2500
Maximum temperature:	1000°F (538°)
Maximum set pressure:	2700 psig (186.2 barg)
Codes:	ASME I and VIII
Bonnet:	Open or closed (heat transfer fluid)

CROSBY H-SERIES

STYLE HSJ

PRODUCT OVERVIEW

Style HSJ safety valves are recommended for use on boilers at design pressure from 15-600 psig (1-41 barg). For economizer, Dowtherm® and Section VIII applications, the valves are designed for pressures to 2700 psig (186 barg) and temperatures to 1000°F (538°C).

HSJ valves are available in sizes 1½" F 2" to 6" Q 8" with ANSI Class 150, 300, 600, 900, 1500 and 2500 inlet flanges.

HIGH PERFORMANCE

The adjustable nozzle ring (3) and guide ring (9) utilize the reactive and expansive forces of flowing steam to provide full lift. Valve capacity is governed by the nozzle throat area alone. With high capacity valves, positive overpressure protection is achieved with the fewest valves.

TWO RING DESIGN

Precise blowdown control is provided by the adjustable two-ring design. Blowdown is adjustable while the valve is installed in the system.

SHUT TIGHT - STAY TIGHT

The FLEXI-DISC® (6) is recessed for pressure and temperature equalization ensuring a flat, tight seal capable of containing system pressure at 93% of the valve's set pressure.

PRECISE POPPING POINT

Centering of the disc (6) through the low friction guide (8) ensures that the valves open precisely at set pressure, even after repeated cycling.

OPTIONS

Closed and open bonnets are available for each valve size up to the maximum pressure rating. Closed bonnet valves, equipped with bonnet vents, are recommended for ASME Section VIII outdoor service. For ASME code Section I, outdoor applications, select an open bonnet with weatherhood. Specify open or closed bonnet when ordering.

Note: bonnet vents are essential for proper valve operation and should not be plugged (except for Style HSJ-DOW).

STYLE HSJ-DOW FOR DOWTHERM® SERVICE

Style HSJ-DOW has been designed to cope with the severe demands placed on a Dowtherm® vaporizer safety relief valve, where temperatures are high and absolute seat tightness is required. This valve is furnished with an unvented closed bonnet, a type A screwed cap and has an alloy steel spring for high operating temperatures.

Style HSJ-DOW meets the requirements of the ASME boiler and pressure vessel code, Section I, part PVG, 'Requirements for organic fluid vaporizer generators'. For organic fluid capacities, consult your sales representative.

STYLE HSJ

STYLE HSJ-DOW

NOTE
Bonnet vent plugged only in HSJ-DOW

* One piece disc (6A) replaces part reference numbers 5, 6 and 7 in orifice sizes F, G, H and J (Class 150, 300, 600 only)

NOTES

1. Consumable spare parts: valve parts which should be replaced as part of any disassembly, and discs and/or disc inserts which must be replaced if seats are damaged.
2. Repair spare parts: valve parts exposed to wear and/or corrosion during normal operation. They are in the fluid flow path and may require replacement as part of any repair.
3. Insurance spare parts: valve parts exposed to process or environmental wear and/or corrosion and may require replacement as part of a major repair.

Emerson recommends that sufficient inventory of spare parts be maintained to support process requirements. Always be sure to use genuine Crosby parts to ensure continued product performance and warranty.

For information on installation and care, instruction No. IS-V3146, 'Installation, maintenance and adjustment instruction for Crosby Style HSJ safety valves' is available on request.

2 G 3	0.503	(324.5)	2700	(186.2)	HSJ-76	HSJ-77	Cl 300

* Select appropriate class to meet pressure/temperature requirements for each application.

Refer to pages 72-75 for pressure/temperature limits for standard class valves per ASME/ANSI B16.34.

NOTES

- Set pressure is limited to either the inlet flange pressure limit per ASME/ANSI B16.34 (pages 72-75) or the maximum set pressure, whichever is lower.
- SA-217 Gr. WC6 is Crosby's standard high temperature material. SA-217 Gr. WC9 is available as an alternative.

NOTES

- Safety valves must be mounted on a nozzle with an inlet diameter equal to or greater than the nominal valve inlet size, dimension A. See ASME boiler and pressure code Section I and ANSI/ASME B31.1 for recommended installation.
 - Dismantling height: an additional 20 inches (508 mm) is required.
 - Bolt holes straddle center line.
- Drain: body drain is ½" NPT for F-N orifices
¾" NPT for P and Q orifices

CROSBY H-SERIES

STYLE HSL DIRECT SPRING SAFETY VALVE

STYLE HSL

The Style HSL is a high capacity full nozzle reaction type flanged steel safety valve designed for saturated and superheated steam service up to 725 psig (50 barg) and 1000°F (538°C).

FEATURES

- Increases Operating Efficiency
 - FLEXI-DISC seat design is recessed for pressure and temperature equalization, ensuring a flat and tight seal.
 - FLEXI-DISC seat tightness up to 93%. For seat tightness greater than 93% consult factory.
 - Meets the requirements of ASME Code Section I, Power Boilers and Section VIII for steam service.
 - May also be used for ASME VIII off boiler steam applications for higher operating pressures.
- Reduces Maintenance Costs
 - Replaceable full nozzle design requiring no special tools facilitates ease of maintenance and longer service life.
 - Single bonnet design allows set pressure changes simply by changing-out the spring.
- Minimizes Installation Costs
 - High discharge coefficient results in the most economical valve selection.

TECHNICAL DATA

Sizes:	1¼" x 1½" to 6" x 8" (DN 32 x DN 40 to DN 150 x DN 200)
Connections:	Flanged inlet to ASME Classes 300 and 600
Temperature rating: Max set pressure:	To 1000°F (538°C) 725 psig (50 barg)
Codes:	ASME I and VIII

CROSBY H-SERIES

STYLE HSL

PRODUCT OVERVIEW

The HSL's adjustable nozzle ring and guide ring (Figure 1) utilize the reactive and expansive forces of flowing steam to provide full lift. With a high K x A, positive overpressure protection is achieved with the fewest valves.

The two-ring design provides precise blowdown control, which can be adjusted while the valve is installed in the system.

Style HSL safety valves incorporate the FLEXI-DISC design. Centering of the disc through a low friction guide ensures the valve opens precisely at set pressure, even after repeated cycling.

There is a choice of inlet flange ratings: The set pressure range for Cl300# valves is 15 psig (1.034 barg) to 330 psig (22.75 barg) and 15 psig (1.034 barg) to 725 psig (50 barg) for Cl600#.

Style HSL safety valves are available with optional test gags, weatherhoods for outdoor applications and Class 150# drip pan elbows. A ring-type joint inlet connection is also available. The entire HSL range of F through Q orifices uses a full nozzle design (Figure 1) to facilitate removal and ease of maintenance.

Certification and type approvals

- ASME Boiler and Pressure Vessel Code Section I and VIII
- National Board of Boiler and Pressure Vessel Inspectors Capacity Certifications
- Canadian Registration Number
- Pressure Equipment Directive (97/27/EC) (ISO 4126-1) (CE)
- China Manufacturing License (TS)

SAFETY VALVE WITH OPTIONAL WEATHERHOOD FOR OUTDOOR SERVICE

OPTIONAL DRIP PAN ELBOWS

For optimum safety valve performance, discharge piping should be supported independently of the valve. This can best be accomplished by installing a slip joint arrangement at the inlet to the riser pipe, using a drip pan elbow.

The riser should be sized sufficiently larger than the slip joint to provide clearance during expansion of the boiler and should be located with enough clearance at the lower end to prevent 'bottoming' on the drip pan. Drain lines should be installed from the discharge elbow and the safety valve body and piped separately from any other drain or vent line.

The size of the drip pan elbow should be at least equal to that of the safety valve outlet size.

The flanged model EFS drip pan elbow should be used without any intermediary connection.

Specifications

Model: EFS
 Sizes: 1½", 2½", 3", 4", 6", 8"
 Flange ANSI Class: 150 (1½" to 8")
 Material: Carbon steel

NOTE

Set pressure is limited to either the inlet pressure limit per ASME B16.34 or the maximum set pressure listed in the tables above, whichever is lower.

CROSBY H-SERIES

STYLE HCA-I-118W ISOFLEX SUPERCRITICAL SERVICE

STYLE HCA-I-118W

Style HCA-I-118W are high capacity reaction type safety valves specially designed to withstand the severe operating conditions on supercritical pressure steam generators.

FEATURES

- Increases Operating Efficiency
 - Restricted lift option for customized capacity, reduced reaction forces and boiler design standardization.
 - Seat tightness up to 93%. For seat tightness greater than 93% consult factory.
 - Two ring control to adjust overpressure and blowdown independently.
 - May also be used for ASME VIII off boiler steam applications for higher operating pressures.
- Reduces Maintenance Costs
 - Interchangeable spare parts minimizes inventory levels.
 - Higher nozzle seat step to extend valve service life.
- Minimizes Installation Costs
 - Packaging designed for quick and easy installation.
 - Easy to set and adjust set pressure while in service.

Certification and type Approvals

- ASME Boiler and Pressure Vessel Code, Section I
- National Board of Boiler and Pressure Vessel Inspectors Capacity Certifications
- Pressure Equipment Directive (97/27/EC) (ISO 4126-1) (CE)
- China Manufacturing License (TS)

TECHNICAL DATA

Inlet sizes:	2½" and 3"
Inlet rating:	CL 4500# butt weld
Outlet rating:	CL 300#
Maximum set pressures:	6200 psig [427 barg]
Temperature range:	to 1100°F [593°C]
Four (4) orifices:	K, K2, M and M2
Blowdown:	4%

* Refer to capacity formula, page 52.

Capacities certified by the national board of boiler and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I, power boilers.

For superheated steam, multiply the saturated steam capacities by superheat correction factor K_{sh} , pages 62-63. Capacities for the HCI-R valves: valves adjust to a minimum of 30% of full rated capacity. Restricted capacity = (% of restricted lift) x ASME rated capacity.

* Refer to capacity formula, page 52.

Capacities certified by the national board of boiler and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I, power boilers.

For superheated steam, multiply the saturated steam capacities by superheat correction factor K_{sh} , pages 62-63. Capacities for the HCI-R valves: valves adjust to a minimum of 30% of full rated capacity. Restricted capacity = [% of restricted lift] x ASME rated capacity.

* Refer to capacity formula, page 52.

Capacities certified by the national board of boiler and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I, power boilers.

For superheated steam, multiply the saturated steam capacities by superheat correction factor K_{sh} , pages 62-63. Capacities for the HCI-R valves: valves adjust to a minimum of 30% of full rated capacity. Restricted capacity = (% of restricted lift) x ASME rated capacity.

Capacities certified by the national board of boiler and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I, power boilers.

For superheated steam, multiply the saturated steam capacities by superheat correction factor K_{sh} , pages 62-63. Capacities for the HCI-R valves: valves adjust to a minimum of 30% of full rated capacity. Restricted capacity = (% of restricted lift) x ASME rated capacity.

For steam capacities at 10% overpressure up to absolute pressure of 1500 psia, multiply the capacity from above table by ratio $\frac{1.10p + 14.7}{1.03p + 14.7}$ where p is set pressure (psig)

* Capacity formula:
 $W = (51.5 \times AP \times K)$
 For pressures over 1500 psig and up to 3200 psig the value of W shall be multiplied by $\frac{0.1906P - 1000}{0.2292P - 1061}$

where:
 W = Rated capacity, lbs/hr
 $P = (1.03 \times \text{set pressure}) + 14.7 = \text{absolute pressure, psia}$
 $K = 0.878 = \text{average coefficient of discharge}$
 $A = \text{Nozzle throat (orifice) area, sq.in.}$

Capacities certified by the national board of boiler and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I, power boilers.

For superheated steam, multiply the saturated steam capacities by superheat correction factor K_{sh} , pages 62-63. Capacities for the HCI-R valves: valves adjust to a minimum of 30% of full rated capacity. Restricted capacity = (% of restricted lift) x ASME rated capacity.

Capacity formula: capacity is calculated by converting valve set pressure in barg or kPag psig, calculating in pounds per hour by ASME Section I capacity formula, and converting to kilograms per hour.

Capacities certified by the national board of boiler and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I, power boilers.

For superheated steam, multiply the saturated steam capacities by superheat correction factor K_{sh} , pages 62-63. Capacities for the HCI-R valves: valves adjust to a minimum of 30% of full rated capacity. Restricted capacity = (% of restricted lift) x ASME rated capacity.

Capacity formula: capacity is calculated by converting valve set pressure in barg or kPag psig, calculating in pounds per hour by ASME Section I capacity formula, and converting to kilograms per hour.

Capacities certified by the national board of boiler and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I, power boilers.

For superheated steam, multiply the saturated steam capacities by superheat correction factor K_{sh} , pages 62-63. Capacities for the HCI-R valves: valves adjust to a minimum of 30% of full rated capacity.

Restricted capacity = (% of restricted lift) x ASME rated capacity.

Capacity formula: capacity is calculated by converting valve set pressure in barg or kPag psig, calculating in pounds per hour by ASME Section I capacity formula, and converting to kilograms per hour.

For steam capacities at 10% overpressure up to absolute pressure of 103.4 barg, multiply the capacity from above table by ratio $1.10p + 1.014$ where p is set pressure (barg) $1.03p + 1.014$

NOTES

- For steam capacities at 10% overpressure, multiply the capacity from the above table by the ratio $\frac{1.10p + 14.7}{1.03p + 14.7}$ where 'p' is set pressure (psig).
- For superheated steam, multiply the saturated steam capacities by Superheat correction factor K_{sh} on pages 60-61.

* Capacities certified by the national board and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code. Section I power boilers.

Capacity formula:

$$W = (51.5 \times AP \times K)$$

where:

- W Rated capacity, lbs/hr.
- P $(1.03 \times \text{set pressure}) + 14.7 = \text{absolute pressure, psia}$
- K 0.869 = average coefficient of discharge
- A Nozzle throat (orifice) area, sq. in.

* Capacities certified by the national board and pressure vessel inspectors in accordance with the ASME boiler and pressure vessel code, Section I power boilers

Capacity formula:

$$W = (51.5 \times AP \times K)$$

where:

W Rated capacity, lbs/hr.

P $(1.03 \times \text{set pressure}) + 14.7 =$ absolute pressure, psia

K 0.869 = average coefficient of discharge

A Nozzle throat (orifice) area, sq. in.

NOTES

- For steam capacities at 10% overpressure, multiply the capacity from the above table by the ratio $\frac{1.10p + 14.7}{1.03p + 14.7}$ where 'p' is set pressure (psig).
- For superheated steam, multiply the saturated steam capacities by Superheat correction factor K_{sh} on pages 62-63.

Capacity formula

Capacity is calculated by converting valve set pressure in barg to psig, calculating in pounds per hour by ASME Section I Capacity formula, and converting to kilograms per hour.

* Flowing pressure is the valve set pressure plus the overpressure plus the atmospheric pressure 14.7 psia (1.014 bara).

For superheated steam, multiply the saturated steam capacity by correction factor - K_{sh} ASME Section III, division I - appendices Table XVIII-1110-1.

* Flowing pressure is the valve set pressure plus the overpressure plus the atmospheric pressure 14.7 psia (1.014 bara).

For superheated steam, multiply the saturated steam capacity by correction factor - K_{sh} ASME Section III, division I - appendices Table XVIII-1110-1.

SIZING

SIZING ASME SECTION I SAFETY VALVES

ASME Section I safety valves are devices designed to protect power boilers during an overpressure event. The proper sizing, selection, manufacturing, assembly, testing and maintenance are all critical to obtain optimum protection.

ASME code Section I

1 Boilers-safety valve requirements (PG-67)

- a. Boilers having more than 500 sq. ft. of bare tube and boilers having combined bare tube and extended water heating surfaces exceeding 500 sq. ft. as well as a design steam generating capacity exceeding 4000 lb/hr (1814 kg/hr) must have two or more safety valves. If only two safety valves are used, the relieving capacity of the smaller must not be less than 50% of that of the larger, so if only two valves are used, select valves so that each will relieve approximately half of the total boiler capacity.

2 Superheater safety valve requirements (PG-68)

- a. Boilers having attached superheaters must have at least one valve on the superheater. The valves on the drum must be large enough to relieve at least 75% of the total boiler capacity. It is good practice to size the superheater valve to relieve approximately 20% of the total boiler capacity to protect the tubes against overheating.

3 Reheater safety valve requirements (PG-68)

- a. Boilers having reheaters must have at least one safety valve on the reheater outlet capable of relieving a minimum of 15% of the flow through the reheater. The remainder of the flow through the reheater may be discharged by safety valves on the reheater inlet.

4 Economizer safety relief valves requirements (PG-67) (closed bonnet type valve)

- a. Any economizer which may be shut off from the boiler, thereby permitting the economizer to become a fired pressure vessel, shall have one or more safety relief valves with a total discharge capacity, in lbs/hr, calculated from the maximum expected heat absorption in BTU/hr, as determined by the manufacturer, divided by 1000.

Safety relief valves in hot water service are more susceptible to damage and subsequent leakage than safety valves relieving steam. It is recommended that the maximum allowable working pressure of the boiler and the safety relief valve setting be selected substantially higher than the desired operating pressure so as to minimize the times the safety valve must lift.

5 Organic fluid vaporizer safety valve requirements (Dowtherm service, PVG-12)

- a. Safety valves shall be totally enclosed and shall not discharge to atmosphere, except through an escape pipe that will carry such vapors to a safe point of discharge outside of the building.
The safety valve shall not have a lifting lever and valve body drains are not mandatory. A rupture disc may be installed between the safety valve and the vaporizer.

The required minimum safety valve relieving capacity shall be determined from the formula:

$$W = \frac{C \times H \times 0.75}{h}$$

where:

h = Latent heat of heat transfer fluid at relieving pressure, Btu/lb

W = Weight of organic fluid vapor generated per hour, lb

C = Maximum total weight or volume of fuel burned per hour, lb or cu ft

H = Heat of combustion of fuel, Btu/lb or Btu/cu ft

The sum of the safety valve capacities marked on the valves shall be equal to or greater than W.

CROSBY H-SERIES

SIZING

6 Sample calculations - boiler set sizing

Boiler Specifications:

- Total steam generation: 1450000 lbs/hr
- Design pressure (MAWP): 3000 psig
- Drum operating pressure: 2835 psig
- S.H. outlet temperature: 1000°F
- S.H. outlet operating pressure: 2680 psig

The superheater valve should relieve between 15% and 20% of the total generation capacity, or 217500 lbs/hr to 290000 lbs/hr

The superheater safety valve should be set to operate before the low set drum valve.

To determine superheater safety valve set pressure:

$2835 \text{ psig (drum operating pressure)} - 2680 \text{ psig (superheater outlet operating pressure)} = 155 \text{ psi (SH pressure drop)}$.

$3000 \text{ psig (design pressure)} - 155 \text{ psi} - 20 \text{ psig* (SH pressure drop)} = 2825 \text{ psig (set pressure)**}$.

* The 20 psig subtracted from the superheater pressure drop is done to ensure that the superheater safety valve opens before the low set drum safety valve.

** Can round set pressure up or down for even number.

The superheat correction factor K_{sh} is found on pages 62-63. First convert set pressure gauge to flowing pressure absolute by:
 $2825 \text{ psig} \times 1.03 + 14.7 = 2924.45 \text{ psia}$.
At 2924.45 psia and 1000F the $K_{sh} = 0.711$

To relieve 217,500 lbs/hr superheated steam, the superheater valve must relieve $217500/0.711 = 305907 \text{ lb/hr}$ saturated steam. From capacity table, page 52, a K2 orifice valve set at 2825 psig will relieve 381228 lbs/hr saturated steam or $381228 \times 0.711 = 271053 \text{ lbs/hr}$ superheated steam.

A 2½ x K2 x 6 HCI-98W with welded inlet is required.

The balance of steam to be relieved by drum valves:

$1450000 - 271053 = 1178947 \text{ lbs/hr}$ (drum valves must relieve a minimum of 75% total boiler cap).

Low set drum valve must = 3000 psig (MAWP-PG-67.3)

High set drum valve = $1.03 \times 3000 = 3090 \text{ psig (PG-67.2)}$

The average set pressure for drum valve = 3045 psig.

From capacity table, page 52, at 3045 psig; two M orifice valves will discharge $604733 \times 2 + 1209466 \text{ lbs/hr}$. Selection should be based on price comparison and also on using as many valves as practical of the same size. In this case, two M orifice valves should be used. Actual valve capacities from capacity Table, page 50:

1st drum valve, 3 x M x 6 HE-96W
3000 psig - 590497 lbs/hr

2nd drum valve, 3 x M x 6 HE-96W
3090 psig - 619478 lbs/hr

Total capacity drum valves:
1209975 lbs/hr (83.4%)

Capacity of superheater valve:
271053 lbs/hr (18.7%)

Total safety valve capacity:
1481028 (102%)

Rechecking, the drum valves relieve 83.4% of total boiler capacity (complying with ASME code requirement that drum valves relieve at least 75% of boiler capacity). Superheater valve relieves 18.7% of total boiler capacity - within the desirable range of 15% to 20% of total boiler capacity.

CROSBY H-SERIES

OUTLET REACTION FORCES

OUTLET REACTION FORCES STYLES HE, HCI, HSJ

Total resultant force at outlet elbow*

The figure (right) shows a safety valve open and discharging at full capacity, with a 90° outlet elbow. The horizontal reaction force (F_h) is balanced by the force of discharging steam acting on the 90° elbow.

The vertical force (F_v) at the 90° elbow is unbalanced and exerts a bending moment on the valve. The vertical force (F_v) is the resultant of the reaction due to velocity and the static pressure of the steam acting on the area of the elbow when the valve is open and discharging.

The basic equation for this is:

$$F_v = \frac{WV + (AP_e)}{g_c}$$

where:

- F_v = Vertical force
- W = Flow in lbs/sec
- V = Velocity, ft/sec
- A = Area of outlet, sq. in.
- P_e = Static pressure in outlet elbow, psig
- g_c = Gravitational constant

* Determination of outlet reaction forces is the responsibility of the designer of the vessel and/or piping.

OUTLET REACTION FORCES

OUTLET REACTION FORCES* STYLES HE, HCI, HSJ

Total resultant force at outlet elbow

The figure (right) shows a safety valve open and discharging at full capacity, with a 90° outlet elbow. The horizontal reaction force (F_h) is balanced by the force of discharging steam acting on the 90° elbow.

The vertical force (F_v) at the 90° elbow is unbalanced and exerts a bending moment on the valve. The vertical force (F_v) is the resultant of the reaction due to velocity and the static pressure of the steam acting on the area of the elbow when the valve is open and discharging.

The basic equation for this is:

$$F_v = \frac{WV + (AP_e)}{g_c}$$

where:

- F_v = Vertical force - (kN)
- W = Flow in
- V = Velocity
- A = Area of outlet, sq. mm
- P_e = Static pressure in outlet elbow, barg
- g_c = Gravitational constant

* Determination of outlet reaction forces is the responsibility of the designer of the vessel and/or piping.

Total resultant force at outlet elbow²

The figure (right) shows a safety valve open and discharging at full capacity, with a 90° outlet elbow. The horizontal reaction force (F_h) is balanced by the force of discharging steam acting on the 90° elbow.

The vertical force (F_v) at the 90° elbow is unbalanced and exerts a bending moment on the valve. Vertical force (F_v) is the resultant of the reaction due to velocity and the static pressure of the steam acting on the area of the elbow when the valve is open and discharging.

NOTES

1. Flowing pressure is the valve set pressure plus the overpressure plus the atmospheric pressure (14.7 psia) in psia or bara.
2. Determination of outlet reaction forces is the responsibility of the designer of the vessel and/or piping.

The basic equation for this is:

$$F_v = \frac{WV + (AP_e)}{g_c}$$

where:

- F Vertical force
- W Flow in lbs/sec
- V Velocity, ft/sec
- A Area of outlet, sq. in.
- P_e Static pressure in outlet elbow, psia
- g_c Gravitational constant

CROSBY H-SERIES

OPTIONAL EQUIPMENT

OPTIONAL EQUIPMENT

Drip pan elbows

For optimum safety valve performance, discharge piping should be supported independently of the valve. This can best be accomplished by installing a slip joint arrangement at the inlet to the riser pipe, using a drip pan elbow.

The riser should be sized sufficiently larger than the slip joint to provide clearance during expansion of the boiler and should be located with enough clearance at the lower end to prevent 'bottoming' on the drip pan.

Drain lines should be installed from the discharge elbow and the safety valve body and piped separately from any other drain or vent line. The size of the drip pan elbow should be at least equal to that of the safety valve outlet. The flanged Model EFS drip pan elbow should be used without any intermediary connection.

Specifications

- Model:** EFS
- Sizes:** 1½", 2", 2½", 3", 4", 6", 8" and 10"
- Flange**
- ANSI class:** 150 (1½" to 10")
300 (3" to 10")
600 (3")
- Material:** Carbon steel

CROSBY H-SERIES

OPTIONAL EQUIPMENT

Weatherhoods

Safety valves for outdoor installations should be supplied with weatherhoods to protect the exposed spring and upper structure from weather and thermal effects. They are available for all series H valves.

Reseating machines

Reseating machines will remachine the nozzle seats in place without removing the safety valve from the installation. Form cutters are used to cut a new seat to exact dimensions. Reseating machines, cutters and auxiliary equipment may be rented or purchased.

Jacking devices

When a safety valve is to be disassembled, the spring compression, i.e. the set pressure, can be retained by use of a mechanical or hydraulic jacking device. These are used to lift the lower spring washer sufficiently to allow the disc insert to lift clear of the nozzle, permitting the entire bonnet assembly to be removed. Jacking devices may be rented or purchased.

Air (ASPD) and hydraulic (HSPD) set pressure devices

The set pressure of safety valves can be determined without raising system pressure to the popping pressure of the valves by using a set pressure device, which may be rented or purchased.

The apparatus consists of a lifting device mounted on the bonnet and connected to the spindle of the safety valve. The differential force, required to open the safety valve when the system (steam) pressure is less than the valve set pressure, is applied by the operator. The differential force at which the valve opens is determined and the set pressure is calculated from this measurement.

For details of all the optional equipment available, contact your local sales representative.

Also available:

- Lapping blocks
- Lapping block resurfacing plates

ORDERING INFORMATION

ORDERING INFORMATION

H Series safety valves are for steam service on steam generators, unfired pressure vessels and pipe lines. To assist customers in selecting the right safety valves to suit a specific application, Crosby will recommend the most suitable safety valve, size and style. To enable us do this, the following information is required:

Steam generators

- Type
- Service
- Valve inlet (welded or flanged)
- Maximum rate of steam generation
- Design pressure
- Drum operating pressure
- Superheater outlet temperature
- Superheater outlet operating pressure
- Reheater steam flow (if any)
- Reheater inlet operating pressure
- Reheater inlet temperature
- Reheater outlet operating pressure
- Reheater outlet temperature
- Applicable code (ASME Section I or Section VIII)
- Indicate if for outdoor service

Unfired pressure vessel service

- Required capacity
- Design pressure of vessel
- Operating pressure
- Maximum operating temperature
- Applicable code

Existing boilers

- Design pressure (or maximum allowable working pressure if below design pressure)
- Maximum operating pressure (drum and superheater)
- Maximum rate of steam generation or heating surface and type of firing
- Number and size of openings for safety valves (if special flanges - diameter of bolt circle, number and size of holes)

Organic fluid vaporizer (Dowtherm) service

- Name of fluid
- Molecular weight or specific gravity
- Required capacity lbs/hr of organic fluid

For customers who wish to size their own safety valves, orders should include the following data:

Data	Example
Code requirements	ASME Section I
Quantity of valves	Two
Size - inlet x orifice x outlet	2½" x K2 x 6"
Style	HCI-46W
Set pressure	1 at 1150 psig (79 barg) 1 at 1200 psig (83 barg)
Required capacity (total) (or indicate actual valve capacity)	280,000 lbs/hr (127,000 kg/hr) (Total)
Temperature - saturated or °F [°C]	Saturated
Maximum operating pressure	
Drum	1000 psig (69 barg)
Superheater	None
Connections (rating and facing)	Buttweld inlet ANSI CL 150 outlet - RF

CROSBY H-SERIES

ORDERING INFORMATION

SELECTION GUIDE - Style HE ISOFLEX®

Example:	2½ K 6	HE	-W	-8	6	-C
Size (Inlet x orifice x outlet)						
2½ K 6 to 4 P2 8						
Valve series						
HE		HE ISOFLEX® High capacity safety valve				
Inlet connection type⁽¹⁾						
None		Flanged inlet connection				
-W		Butt weld inlet connection				
Pressure rating						
-8		2500 psig maximum pressure (172 barg)				
-9		3000 psig maximum pressure (207 barg)				
Temperature limit / body material						
6		750°F / SA216 WCC (399°C)				
Cap and lifting lever type						
-C		(Standard) Regular lifting lever				

NOTES

- Welded inlets are standard for HE valves.
For optional 2500# flanged inlet valves, the 'W' is dropped from model #.

Model # examples:

- 2½ K 6 HE-W-86-C
- 3 M2 6 HE-W-96-C
- 4 P2 8 HE-W-86-C

SELECTION GUIDE - Style HCI ISOFLEX®

Example:	3 M2 6	HCI	-8	6	W	-C
Size (Inlet x orifice x outlet)						
1½ H2 3 to 6 RR 10						
Valve series						
HCI		HCI ISOFLEX® High capacity safety valve				
HCI-R		HCI ISOFLEX® Restricted lift high capacity safety valve				
Pressure rating						
-3		ANSI CL 300 inlet				
-4		ANSI CL 600 inlet				
-5		ANSI CL 900 inlet				
-6		ANSI CL 1500 inlet				
-7		ANSI CL 900 inlet (ANSI CL 300 outlet)				
-8		ANSI CL 1500 inlet (ANSI CL 300 outlet)				
-9		ANSI CL 2500 inlet				
Temperature limit / body material						
6		750°F / SA216 WCC (399°C)				
8		1050°F / SA217 WC6 (566°C)				
9		1100°F / SA217 WC9 (594°C)				
-C12A		1130°F / SA217 C12A (610°C)				
Inlet connection type⁽¹⁾						
None		Flanged inlet connection				
W		Butt weld inlet connection				
Cap and lifting lever type						
-C		(Standard) Regular lifting lever				

NOTES

- Welded inlets are standard for HCI valves.
For optional flanged inlet valves, the 'W' is dropped from model #.

Model # examples:

- 3 M2 6 HCI-79W-C
- 2 J2 4 HCI-R-46-C
- 1½ H2 4 HCI-86W-C

INSTALLATION RECOMMENDATIONS

SAFETY VALVE INSTALLATION RECOMMENDATIONS

Safety valves are intended to open and close within a narrow pressure range; therefore, valve installations require careful and accurate design both as to inlet and discharge piping. The higher the operating pressure and the greater the valve capacity, the more critical becomes the need for proper design of the installation. (ASME/ANSI power piping code B31.1).

Inlet piping^[1]

Safety valves should always be mounted in a vertical position directly on nozzles having a well rounded approach that provides smooth, unobstructed flow from the vessel or line to the valve. A safety valve should NEVER be installed on a nozzle with an inside diameter smaller than the inlet connection to the valve or on excessively long nozzles.

The pressure drop occurring in the inlet piping between the valve and pressure source should be computed at actual flow of the valve, bearing in mind that the ASME boiler code, Section I rating for safety valves is only 90% of the actual flow. The safety valve or safety relief valve(s) should be connected to the boiler independently of any other connection and attached as close as possible to the boiler or the normal steam flow path without any unnecessary intervening pipe or fitting. Any intervening pipe or fitting should be no longer than the face-to-face dimension of the corresponding tee fitting of the same diameter and pressure under the applicable American national standard. The wall thickness of the inlet piping must be heavy enough to resist bending moments due to reaction when the valve discharges.

Outlet reaction forces

The forces created by the steam discharging from a safety valve will impose a reactive load on the inlet of the valve, the mounting nozzle and the adjacent supporting vessel.

The precise nature of the loading and the resulting stresses will depend on the configuration of the valve and the discharge piping. This must be taken into consideration by those responsible for the installation of the safety valve and associated vessel or piping. Determination of outlet reaction forces is the responsibility of the vessel and/or piping designer (see pages 78-82).

Boilers

It is recommended that the absolute minimum differential pressure, i.e. the pressure between the valve set pressure and operating pressure, is not less than 5% to ensure seat tightness. Nozzles for safety valves on boiler steam drums must have inside diameters equal to the valve nominal size. Nominal diameter plus 1/2" (15 mm) or more is recommended, particularly for valves mounted off the center line of the drum.

Pipe lines

Where safety valves are installed to protect a piping system, as on the low pressure side of a reducing valve or on a turbine bypass, the pipe or header must be of sufficient size to maintain flow under the safety valve while it is discharging. On a pressure reducing valve installation, the safety valves should be located at least eight pipe diameters downstream from the pressure reducing valve. Where nozzles are used, they must be as short as possible, preferably one pipe size larger than the valve inlet and designed to counterbalance the reaction when the valve discharges. Several smaller valves are better than one large valve and the set pressure of each valve should be staggered within ASME boiler and pressure vessel code limitations.

1. Request paper by J.R. Zahorsky titled: 'Degradation of pressure relief valve performance caused by inlet piping configuration'.

CROSBY H-SERIES

INSTALLATION RECOMMENDATIONS

Discharge piping^[2]

The discharge piping from safety valves should be equal in size to, or larger than, the nominal valve outlet and should be as simple and direct as possible.

Connections with generous clearances are preferred. The discharge pipe above the drip pan should be sized adequately to avoid 'blow back' of steam from around the drip pan into the boiler room when the valve is discharging. Where piping extends to a considerable length, it may be necessary to increase the pipe size at the upper part of the stack.

Where flexible hose connections are used in place of or in conjunction with drip pans, they must be of sufficient length and flexibility to absorb expansion and impose no strains on the valve outlet when the pressure vessel is at normal operating pressure.

Where solid piping must be used, expansion bends should be employed for the same purpose.

Headers

On superheater and reheater headers, inlet nozzle connections for safety valves should be as short as possible. Piping nozzles should have a rounded entrance and larger ID than the valve nominal size. This is often necessary to keep the inlet pressure drop within limits. Such connections should be away from turns or branches, which can cause turbulence. The exit from the header or riser should be larger than the valve inlet, have a well rounded approach and a uniform reduction of diameter with no abrupt changes, preferably with a smooth, gradual taper (similar to a seamless reducing or Y fitting). The design should also result in minimum pressure drop from the header or riser to the safety valve.

- Design considerations are included in the following articles: 'Steam flow through safety valve vent pipes' by H.E. Brandmaier and M.E. Knebel (December 1975), 'Analysis of power plant safety and relief valve vent stacks' by G.S. Liao (November 1974), and 'Safety valve vent pipe sizing for open discharge systems' by J.W. Sale (June 1979). The latter papers are ASME publications.

CROSBY H-SERIES

INSTALLATION RECOMMENDATIONS

Discharge manifolds

Discharge manifold lines are satisfactory if the following 'good practices' are observed: The area of the manifold should be equal to or larger than the areas leading into it. 'Stepping up' the size of the manifold at each point where another valve discharge line enters permits smoother flow than simply sizing the manifold to the total area required. The manifold should be supported independently and not on the valves. The same precautions should be observed in providing drip pans, flexible connections and expansion bends on the individual discharge valve lines leading into the manifold. The manifold should be anchored adequately to prevent it from swaying and with adequate drains provided.

The discharge lines should be led into the manifold at an angle of 45° (less if possible) to the direction of the steam flow. The manifold should be checked for possible back pressure which might cause steam 'blow back' out of individual drip pans. If closed systems are used, back pressure in the manifold resulting when one valve discharges can affect the popping point and the performance of other valves connected to the same system.

Note: all piping in the discharge system must be vented to a safe disposal area to prevent personnel injury when the valve discharges.

Drains

Provisions for drains are located in the valve bodies and should be piped to a drainage system to remove condensate. Separate drains are recommended to drain the drip pan and on certain types of installations additional drainage from the discharge piping may be provided. This is especially true in marine installations where it is essential that the main atmospheric exhaust stack is provided with a drain pocket at the lowest point and that a separate drain line is carried from this pocket to the bilge.

Note: all drains and piping in the discharge system must be piped to a safe disposal area to prevent possible personnel injury when the valve discharges.

Hydrostatic testing of boilers

Hydrostatic test plugs are recommended for use on welded inlet valves. If flanged inlet valves are to be installed, we recommend that the hydrostatic test is completed prior to installing the safety valve by blanking off the boiler opening. A hydrostatic test plug is supplied for all welded inlet valves. Hydrostatic test plugs can be supplied on request for any flanged inlet safety valve.

Please consult the Crosby technical literature for details on the specific type and use of hydrostatic equipment available.

PRESSURE RELIEF DEVICE SIZING AND SELECTION SOFTWARE

Emerson PRV2SIZE incorporates over 135 years of experience and engineering expertise for an extensive array of Anderson Greenwood, Crosby and Varec pressure relief devices and related products in one software package. With Emerson PRV2SIZE customers and engineers can address numerous applications in a single sizing and selection platform without the need to use two or more sizing programs.

Emerson PRV2SIZE features:

- Improved user interface
 - Sizing calculations can be saved at any point
 - Multiple tags can be opened at one time
- Capability of sorting data using a variety of parameters
- Fully configured product selection
- Industry standard sizing methodologies
- Drop-down boxes allow instantaneous change of sizing methodology from API to ASME and vice versa
- Addition of 2:1 elliptical head tanks for fire sizing applications
- Catalog integration from existing product literature PDF's
- Detailed product specifications including cross sectional drawings with dimensions and weights - U.S. Customary System and Metric units
- Improved tools to export and import device tag numbers with the ability to mail files directly from the software program
- Combination device, reaction force and noise level calculations
- Addition of flow curves for pressure and vacuum relief valves
- Individual capsule summaries of each product including an image of the selected product

Another unique feature of Emerson PRV2SIZE is its capability to provide sizing and selection for tank protection and tank blanketing products in a single software program. This includes pad and de-pad valves, tank blanketing regulators, pressure/vacuum vents and low pressure pilot operated relief valves.
